Suricata Network Security Dashboard Copy

Edit Export ...

This dashboard provides real-time visibility into attacker activity captured by Suricata across the T-Pot honeypot environment. It aggregates and visualizes network intrusion detection data across eight categories: baseline event distribution, alert signatures and severity, reconnaissance and scanning behavior, port and flow targeting, malware and file transfer activity, HTTP request analysis, SMB lateral movement, and full per-IP investigation timelines. Each panel is built on custom SPL queries that extract structured fields from raw Suricata logs, enabling analysts to move from high-level threat overview down to individual attacker kill chains. The dashboard is designed to support SOC-style analysis, detection engineering workflows, and incident response triage within a layered security monitoring architecture that combines network-level intrusion detection with host-level honeypot deception data from Cowrie.
